

# **EXCLUSIVE: 80 of the most common adverse events reported after Covid-19 vaccination**

Dated: October 5, 2021 by [Sharyl Attkisson](#) [Leave a Comment](#)

## **An original analysis**

The following is an exclusive analysis of illnesses and disorders occurring after Covid-19 vaccination as reported to Vaccine Adverse Event Reporting System (VAERS), a federal database. It does not include all of the adverse events reported; it summarizes some of the most common or problematic categories.

[Report an adverse event after vaccination online here.](#)

A report does not necessarily prove the illness or death was caused by the Covid vaccine. The system is designed to collect adverse events after vaccination to uncover any patterns not captured during vaccine studies.

Scientists have estimated that adverse events caused by medicine occur at a rate up to 100,000 times higher in the general population than what's officially reported, since it's established that most adverse events aren't reported to the database. However, some claim Covid-19 vaccine adverse events are not as likely to be underreported, due to close monitoring and widespread publicity surrounding Covid-19 vaccination.

According to the Centers for Disease Control (CDC) and Food and Drug Administration (FDA), the benefits of Covid-19 vaccination outweigh the risks for all groups and age categories authorized to receive it.
